

A Two-sample Approach for State Estimates of a Chronic Condition Outcome

Peter F. Graven

2010 National Conference on Health
Statistics

August 17, 2010 Washington, DC

Acknowledgements

- Research funded by a grant from the Robert Wood Johnson Foundation (RWJF) to the State Health Access Data Assistance Center (SHADAC) at the University of Minnesota, School of Public Health
- Travel funded by the National Center for Health Statistics

Objective

- To produce state estimates of health information in the NHIS (chronic condition, pre-existing condition, etc.)
 - NHIS does not include state in its public use file
 - restricted access file provides some opportunity but sample design not intended for state-level estimates
- To calculate appropriate errors for the estimates for comparison between states or as inputs in other analyses
- Predict/impute an outcome measure (condition status) in a survey with state-level sample design (CPS, ACS) using NHIS data

Method

- Applying elements of method used in (Schenker, N., Raghunathan, T., Bondarenko, I., 2010) *
 - imputed clinical values of hypertension, diabetes and obesity in NHIS with self-reported values and both clinical and self-reported values from NHANES
 - self-reported rates were lower than clinical values
 - requires multiple imputation techniques and propensity scores

*Schenker, N., Raghunathan, T., Bondarenko, I., "Improving on analyses of self-reported data in a large-scale health survey by using information from an examination-based survey". *Statistics in Medicine*, Volume 29, Issue 5, pages 533–545, February 2010

Method-Data

- National Health Interview Survey (NHIS) 1997-2001, 2004-2008
 - Minnesota Population Center and State Health Access Data Assistance Center, *Integrated Health Interview Series: Version 2.0*. Minneapolis: University of Minnesota. <http://www.ihis.us>
 - Harmonizes the data and documentation for the NHIS
 - 1,000's of vars, 38 years, linkable to NHIS data supplements
- Current Population Survey (CPS) 1999, 2006
 - Miriam King, Steven Ruggles, J. Trent Alexander, Sarah Flood, Katie Genadek, Matthew B. Schroeder, Brandon Trampe, and Rebecca Vick. *Integrated Public Use Microdata Series, Current Population Survey: Version 3.0*. [Machine-readable database]. Minneapolis: University of Minnesota, 2010.

Method-Primary Steps

- 1) Assemble Data
- 2) Identify outcome status in NHIS
- 3) Create identically coded covariates in NHIS and CPS
- 4) Predict survey of observation using covariates, create subgroups for model
 - 4b) Predict key variable using covariates
- 5) Impute missing CPS values using predicted survey, covariates (or predicted key variable) and interactions
- 6) Produce estimates of outcome using imputed data

Method- Data Assembly

CPS obs	CPS	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008

Method-Identify Outcome status

- Chronic condition
 - Limitation of activity due to chronic condition
 - asked of all persons
 - ~12% of population nationally

Method- Create Identical Covariates

	CPS	NHIS*		CPS	NHIS*		CPS	NHIS*
Age			Education			Health Status		
0-17	25.0	25.0	No HS Diploma	11.4	12.1	Excellent	33.1	35.5

35-54	29.0	29.1	Some college/associates	20.4	21.3	Good	23.6	24.2
55-64	10.8	10.6	Bachelors or more	19.6	19.3	Fair	7.9	7.2
65-74	6.4	6.4	NIU	25.0	25.0	Poor	3.4	2.4
75+	5.7	5.7	Wages			Insurance Status		
Sex			0-10K	8.0	9.0	Uninsured	15.8	14.8
Male	49.1	48.9	10k-25K	12.6	13.3	Insured	84.2	85.2
Female	50.9	51.1	25k-50K	16.1	17.5	Region		
Marital Status			50K+	13.2	12.3	Northeast	18.2	18.1
Married	42.0	43.3	0/NIU	50.1	47.8	Midwest	22.1	23.4
Not married	33.0	31.7	Poverty			South	36.4	36.1
NIU	25.0	25.0	0-99	13.7	13.4	West	23.3	22.3
Race/Ethnicity			100-199	18.1	19.3	Birthplace		
White-NH	66.1	67.5	200-299	17.1	16.9	US born	86.1	86.7
Black-NH	12.1	12.5	300-399	13.4	13.8	Born outside US	13.9	13.3
Hispanic	15.1	14.9	400-499	10.5	10.2			
Other-NH	6.6	5.1	500+	27.3	26.5			

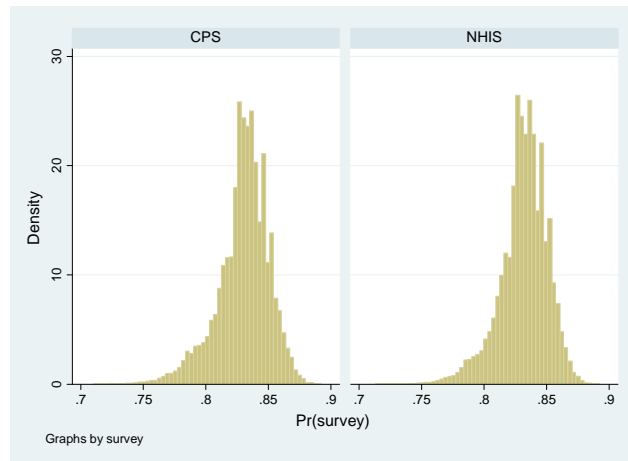

Method-Predict Survey Propensity

- Why do you predict the survey?
 - although the values of covariates are coded the same, the responses in two surveys may not truly be identical.
 - Therefore, by predicting the survey there is a single dimension to assess how likely the observations are to be similar.
- Why predict propensities? Isn't that used for matching studies?
 - for the imputation we are looking for similar observations in different surveys to predict a likely values
- Survey propensity model: age, sex, race, education, marital status, birthplace insurance status, wages, poverty, region

Method-Predict Survey Propensity

- Survey propensity: this predicts which survey an observation is from based on its covariates.
 - Ideally, you would have very similar distributions implying observations are similarly likely in either dataset.
 - This strengthens the case for using NHIS observations to impute CPS observations

Method-Predict Survey Propensity

1= NHIS, 0=CPS

mean>50%
because there are
more NHIS obs
than CPS obs in
the imputation
sample

Similar and
narrow shape
indicates coding is
similar between
surveys.

Results- Model Sensitivity

- Full Imputation Model
 - All covariates interacted by propensity group
 - Possible due to large sample size
- Parsimonious Imputation Model
 - predicted health status interacted by propensity group
 - very similar results due to strength of common health status variable
- Two-Step Model
 - Fit all covariates on NHIS, predict on CPS
 - Standard errors of state means too small

Results-Chronic Prevalence by Survey and Covariates

	<u>CPS</u>	<u>NHIS</u>		<u>CPS</u>	<u>NHIS</u>		<u>CPS</u>	<u>NHIS</u>

Limitations/Future Research

- Limitations
 - Model selection not optimized, primarily an exercise
 - Testing effects would require common variables that should also be included in imputation model
- Future Research
 - Investigate why national means are different
 - Identify more commonly coded variables between surveys
 - Create outcomes that align with pre-existing condition definitions
 - Consider applications for other surveys (MEPS, BRFSS)

Summary

- Newer accessible methods allows for creative integration of data sources with appropriate uncertainty incorporated
- The ability to make valid state estimates is valuable for health policy
 - could be used to develop state estimates of those with pre-existing conditions eligible for the temporary high risk pool

Extra: Results-Upper bound of Unexplained Error at State level

- From 1997-2001 NHIS released MSA names
- Data assembled for 1999 CPS with matching MSA and non-MSA (region) codes.
 - only MSAs with over 1,000 observations in the 5 years of NHIS were used. Others grouped into their region
- The MSA portion of the MSA/Non-MSA(Region) code have smaller populations than states
 - provides an approximate upper bound on the error in the state imputation

Extra: Results-MSA/Region Comparison

Name	CPS		NHIS	
	Mean	SE	Mean	SE
Northeast-Non MSA	14.3	0.53	13.4	0.30
Midwest-Non MSA	14.3	0.39	12.8	0.33
South-Non MSA	14.5	0.33	13.0	0.20
West-Non MSA	12.7	0.34	11.4	0.26
