ACKNOWLEDGEMENTS

A survey of this scope requires adequate funding and diverse skills to ensure the delivery of accurate and comprehensive information about the health insurance coverage of **all** Vermonters. A balanced combination of quantitative and qualitative research can inform health policy discussions more powerfully than the exclusive use of one approach. The 2000 Vermont Family Health Insurance (2000 Vermont Survey) reflects the combined support and efforts of the following agencies, entities and individuals to gather, analyze and disseminate quantitative information about the population of Vermont.

Sponsorship

The 2000 Vermont Survey was sponsored initially by the Vermont Department of Banking, Insurance, Securities and Health Care Administration (BISHCA) and the Office of Vermont Health Access (OVHA) in the Agency of Human Services. The Division of Health Care Administration (HCA) within BISHCA managed the 2000 Survey project and administers state programs in health insurance regulation, consumer assistance/protection and health care cost containment. OVHA administers the second largest health insurance program in the state and manages benefits for all state Medicaid health insurance and prescription drug programs.

The Health Services and Resources Administration (HRSA) of the U.S. Department of Health and Human Services provided additional funding for this survey through a state planning grant awarded to the State of Vermont. The HRSA State Planning Grant Program provides one-year grants to states to develop plans for providing access to affordable health insurance coverage to all their citizens. The additional funding supported the expansion of this survey to support sub-state analysis at regional and county levels.

Getting the Work Done

Successful completion of this survey required participants to work as a team and freely exchange ideas about complex technical issues.

Project Management: Vermont Division of Health Care Administration

Dian Kahn, Director of Analysis and Data Management

Heather K. Dykstra, Health Care Administrator

Survey Contractor: Market Decisions, Inc., South Portland, Maine

Brian Robertson, Ph.D., Director of Research

Noy Sinakatham, Research Associate

Zao Hong Zhou, Statistician

& field staff who successfully interviewed thousands of Vermonters

Survey Consultants: Mathematica Policy Research, Inc.,

Brenda Cox, Ph.D.

Anne Petersen

Special Thanks to the People of Vermont

This survey would not have been possible without the voluntary cooperation of 8,623 Vermonters who took the time to complete the 20-minute telephone interview and made this survey a success.

(THIS PAGE IS INTENTIONALLY BLANK)

EXECUTIVE SUMMARY

- ❖ The statewide uninsured rate is 8.4% (standard error 0.3). This means that the rate may range between 7.8% and 9.0%. This is the range that would be expected to contain the true value at least 95% of the time. The national uninsured rate based on the U.S. Census Bureau's 2000 Current Population Survey is 15.5% (standard error 0.1).
- ❖ With the 2000 population count of 608,830 for Vermont, this means that the point estimate of uninsured is 51,390, but the actual number may be somewhere between 47,481 and 55,299.
- ❖ The uninsured rates for Vermonters aged 0-64 at the county level range from 6.8% in Chittenden County to 13.9% in Lamoille County.
- ❖ The statewide uninsured rate for Vermont's 147,525 children aged 0-17 is 4.2% (standard error 0.4) or a point estimate of 6,190. This means that the rate may range between 3.4% and 5.0% with the count between 5,026 and 7,354. The national uninsured rate for children under 18 is 13.9% based on the U.S. Census Bureau's 2000 Current Population Survey.
- ❖ According to the U.S. Census Bureau's 2000 Current Population Survey, state-specific rates for uninsured children at or below 200% of the federal poverty level range from a low of 2.8% in Vermont to a high of 19.0% in Arizona.
- ❖ The primary coverage sources for Vermont's insured children (95.8% insured) include: 55.0% private insurance only; 37.8% Medicaid (includes Dr. Dynasaur); 2.3% Medicare, and 0.7% military only.
- ❖ Children living in families with incomes between 151% - 200% of the federal poverty level (approximately \$25,000 for a family of three) are more likely to be uninsured in Vermont.
- ❖ The primary coverage sources for Vermont's insured adults aged 18-64 (88.6% insured) include: 73.8% private insurance; 10.8 % Medicaid; 2.8% Medicare; and 1.2% military only.
- ❖ About 76.9% or 34,773 of the 45,199 uninsured Vermont residents aged 18 and older are employed. About 68.2% (30,814) of the uninsured who are 18 and older are employed full-time at their main job.
- ❖ The more workers a Vermont firm employs, the greater the likelihood that the employer offers health insurance. Over 90% of workers in firms with more than 100 employees reported that their employers offered health insurance. 57% of employees in firms with 5-9 employees reported that their employers offered health insurance, while 27% of workers in firms with fewer than 5 employees reported being offered health insurance.
- ❖ Vermonters working for smaller firms are more likely to be uninsured than those working for larger firms. 56% of Vermont's uninsured workers are employed by firms with less than 25 employees.

INTRODUCTION

...Not everything that can be counted counts; and not everything that counts can be counted...

-Dr. Albert Einstein

Why a State-sponsored Health Insurance Survey?

Each state has a unique blend of economic, demographic and political factors affecting access to health insurance coverage. Measuring the impact of changes in the private insurance market and public programs is essential. Monitoring trends in the uninsured rate in selected populations tells us something about availability and affordability of coverage. The direction of change in the uninsured rate influences political debate and legislative decisions pertaining to the regulation of private health insurance and funding of public programs. The federal government uses an annual count of uninsured low-income children in each state to allocate funds for the State Children's Health Insurance Program (SCHIP).

The most commonly used data source for estimating health insurance coverage at the national and state levels is the U.S. Census Bureau's (USCB) Current Population Survey (CPS). This is primarily a labor force survey containing some questions about health insurance. Using this data source for annual estimates of state-specific uninsured rates has been problematic due to small sample size in some states and technical limitations in the survey instrument. The 1999 annual coverage estimate for Vermont (2000 CPS) was derived from a survey of 770 households. National and state samples have been expanded for the 2000 estimate (2001 CPS) with Vermont's sample increasing to 1,730 households. This should decrease the margin of error by 33 percent and yield more accurate statewide estimates when the data are released in late 2001. Several states, including Vermont, report that the CPS uninsured rates exceed rates estimated from larger state-sponsored surveys by an average of 3.1 percentage points. In short, CPS has been found to underestimate participation in state Medicaid programs and overestimate the number of uninsured.¹

In 1993, the state of Vermont participated in the ten-state Robert Wood Johnson Family Survey for the purpose of gathering more accurate and comprehensive data on health insurance coverage in the State. The Department of Banking, Insurance, Securities and Health Care Administration (BISHCA) and the Office of Vermont Health Access (OVHA) jointly sponsored the 1997 Vermont Family Health Insurance Survey (1997 Vermont Survey). The 2000 Vermont Family Health Insurance Survey (2000 Vermont Survey) is built upon this legacy of collecting comprehensive information at the family and individual levels from a larger sample to get an accurate count. With additional funding from a state planning grant awarded by the U.S. Health Services and Resources Administration (HRSA), the 2000 Vermont Survey was expanded to support analysis at the regional and county levels and includes questions about financial access to care.

What is the 2000 Survey Methodology?

The 2000 Vermont Family Health Insurance Survey was designed to provide accurate information about health insurance coverage at the state and county levels within specific levels of precision. Given this requirement, approximately the same numbers of interviews were conducted in each of Vermont's 14 counties. The 2000 Vermont Survey was a random digit-dial (RDD) telephone survey that interviewed 8,623 households with 9,471 families and 22,258 individuals with a statewide margin of error of $\pm 1\%$ and $\pm 3.5\%$ at the county level. The 2000 Vermont Survey was designed to represent all persons living in Vermont families, excluding:(1) those persons residing in households where no one age 18 or over is

¹ State Health Access Data Assistance Center (SHADAC), University of Minnesota School of Public Health. Issue Briefs #1, #2, and #3, 2221 University Avenue SE, Suite 345, Minneapolis, MN 55414. Available at URL: www.shadac.org/publications/pubs.htm.

present; (2) students aged 18 or older living permanently away from home; and (3) persons residing in group homes, dormitories, military barracks, and institutions. The survey had an overall response rate statewide of 68%. Data collection commenced on November 9, 2000 and was completed by January 25, 2001. Per industry standards, interviews were conducted between the hours of 9 a.m. and 9 p.m., seven days a week. The only exceptions were interviews scheduled outside these hours by request of respondents. Eighty-six percent of the interviews were completed in less than 20 minutes.

Since the sampling approach relied on the use of an RDD telephone sample, the sample population includes only households (and residents therein) with telephones. However, the data were adjusted to increase the representation of those without telephone service. Households with interrupted telephone service exceeding 2 weeks during 2000 were weighted to represent households without telephones. Weighting adjustments were also made by county, age, gender, employment, Medicare and Medicaid coverage, and multiple phone lines.

The 2000 Vermont Survey interview applied "family formation logic" so that all members of a household were grouped into family units based upon relationships. This concept is important because of the relationship between variables such as type of health insurance and family characteristics such as income and employment. Data were gathered on up to two family units residing in each household.

What Kind of Information is in the 2000 Survey?

The survey interview gathered information about individuals and families in the following categories:

- Household member familial relationships (family unit formation)
- Household and person level demographic information
- Source and characteristics of health insurance coverage
- Employment and employer characteristics
- Family income and enrollment in government programs
- Reasons for lack of insurance coverage
- Changes in source of insurance coverage
- Prescription drug coverage and burden of cost
- Veteran status and military insurance coverage
- Financial barriers to health care services
- General health status

What do I need to know to understand this report?

Much of the analysis in this report is based upon assigning individuals to health insurance coverage, family income, employment and other meaningful categories. This section discusses some of the categories most frequently used in analysis.

Health Insurance Coverage Categories

During the telephone interview, each respondent was asked to identify the health insurance coverage source for every individual in each family in the household. Respondents were guided through detailed questions about every public health insurance program and private insurance option. If any individual was not assigned to a health insurance coverage source, respondents were asked to verify that the individual was uninsured. Then the interviewer asked how the person would pay for medical expenses. This technique resulted in some individuals initially categorized as uninsured being re-categorized as insured before the interview terminated.

Some individuals have more than one source of health insurance coverage. Over 14,000 Vermont residents, mostly adults, are enrolled in both Medicare and Medicaid. For purposes of this survey, these individuals are counted under Medicare. Many Medicare beneficiaries also have private coverage or Medicare supplemental insurance (Medigap) to cover medical expenses not covered by Medicare. These individuals are counted under Medicare as the major source of coverage. Some children enrolled in the state Dr. Dynasaur program are classified as "underinsured" and are also enrolled in private insurance. Children in other Medicaid programs may also have some degree of private coverage. Children enrolled in both Medicaid and private insurance are counted under Medicaid for purposes of this study.

Family Income Categories

The concept of family income is not very meaningful without adjusting for family size. Eligibility for most state health insurance programs is based on federal poverty level that takes family size into account (Appendix 1). Much analysis of health insurance coverage status and other measures is based on federal poverty level. Each individual in the 2000 survey is assigned to a federal poverty level according to reported family income and family size (Appendix 2).

Employment Categories

There are several types of categorization used to analyze relationships between employment characteristics and health insurance coverage. A worker is defined as anyone who reported having a job for pay within the prior two weeks. This category includes full- and part-time workers. Data quantifying hours worked at "all jobs" and at a "main job" were collected on every employed Vermont resident aged 18 and older. Full-time employment is defined as working 30 or more hours per week at a "main job". "Main job" is defined as where an individual works the most hours per week. Some individuals may work 30 or more hours per week at several part-time jobs, but are not classified as full-time workers.

How precise are the numbers in this report?

Because it was not feasible to survey every resident of Vermont, the survey data provide an estimate of the true value of one or more characteristics. The standard error is used to calculate a range that would be expected to contain the true value at least 95% of the time. To compute this range or margin of error, multiply the measure's standard error times 1.96. This product is then added to the point estimate to calculate the high end of the range (see "Upper Limit" in chart book) or subtracted from the point estimate to determine the low end of the range (see "Lower Limit" in chart book). The larger this range, the more caution should be exercised in making inferences about the data.

Comparative counts from the 1997 Vermont Family Health Insurance Survey may be artificially low due to an underestimation of growth in the Vermont population by the U.S. Census Bureau in the mid-1990s. Therefore, caution should be exercised in formulating inferences based on changes in counts of persons from 1997 to 2000 within various health insurance coverage categories and subcategories.

Will more data be available from this survey?

This chart book is the first in a series of publications analyzing the results of the 2000 Vermont Family Health Insurance Survey. This chart book will be posted in July 2001 on the Department of Banking, Insurance, Security and Health Care Administration's web site at www.bishca.state.vt.us. A more comprehensive report with more data will be released in August 2001 and will be available on the BISHCA web site. Additional materials such as the survey instrument and technical documentation about sample design, survey methods, imputation and weighting will also be posted on the BISHCA web site in August 2001. For any questions about the survey, call the Vermont Division of Health Care Administration at (802) 828-2900.

Other contact information

For further information about eligibility for state health insurance programs, please contact the Office of Vermont Health Access at 1-800-250-8427.

For consumer assistance with questions about health insurance in Vermont, please contact consumer services at the Vermont Division of Health Care Administration at 1-800-631-7788.

Medicare*	87,937	14.44%	0.4057	83,095	92,779	13.64%	15.24%
Uninsured	51,390	8.44%	0.3276	47,481	55,299	7.80%	9.08%
Total	608,830	100.00%					

* About 14,000 Vermont residents are dually enrolled in Medicare and Medicaid. These lives are counted under Medicare and are NOT counted under Medicaid.

UNINSURED RATE VERMONT VS. U.S.

	Uninsured	Insured	Total
Vermont	8.4%	91.6%	100.0%
U.S.	15.5%	84.5%	100.0%

U.S. Data Source: U.S. Census Bureau, Current Population Survey, March 2000, Table E. Percent of People Without Health Insurance Coverage Throughout the Year by State (3-year Average): 1997 to 1999.

VT Data Source: 2000 Vermont Family Health Insurance Survey

UNINSURED RATES UNINSURED VERMONT RESIDENTS, 1997 vs. 2000

Year	Count	Percent	Standard Error	Count		Percent	
				Lower Limit	Upper Limit	Lower Limit	Upper Limit
1997*	40,076	6.80%	0.918	29,472	50,680	5.00%	8.60%
2000	51,390	8.44%	0.3276	47,481	55,299	7.80%	9.08%

* Caution should be exercised in drawing inferences about changes in the number of lives from 1997 to 2000 within health insurance coverage categories due to differences in the standard errors between the two surveys. Population estimates for 1997 were probably lower than the actual count due to inaccurate projections by the U.S. Census Bureau based on the 1990 Census.

*The total number of privately insured Vermont residents aged 0-64 in 2000 was 364,428. However, if the private insurance policy holder did not reside in the Vermont household that was surveyed, then the "Cost Burden of Health Insurance" was not asked. It was thought that if the policy holder did not reside in the surveyed household, the respondent may not have adequate information to answer the above question. This explains why the total is 354,413 and not 364,428.
