

# A STATE-LEVEL LOOK AT FLU VACCINATION RATES AMONG KEY POPULATION SUBGROUPS

SHADAC's analysis of 2017-2019 Behavioral Risk Factor Surveillance System (BRFSS) Data.

## Minnesota

Though there is no consensus on one singular figure needed to achieve what is commonly known as “herd immunity” (i.e., sufficient levels of COVID vaccinations in order to achieve protective population immunity) scientists and researchers have generally agreed on a range of 70-90% of the population being vaccinated. For simplicity, we use the lower end of the target range (70%) as a comparison for these state profiles.

Using data from the U.S. Centers for Disease Control and Prevention's (CDC) Behavioral Risk Factor Surveillance System (BRFSS) survey, these profiles give a deeper look into flu vaccination rates across the states among U.S. adults (age 18+) as a proxy to identify population subgroups that may be harder to reach with a COVID-19 vaccine.

### State Flu Vaccination Rate vs. COVID-19 Herd Immunity Threshold

STATE RATE

44%

HERD IMMUNITY THRESHOLD

70%

### Flu Vaccination Rates by Age

### Flu Vaccination Rates by Race/Ethnicity

### Flu Vaccination Rates by Insurance Status

### Flu Vaccination Rates by Household Income

\* Significantly different from the statewide rate (adults age 18+) at 95% confidence level.

### State vs. National Adult Flu Vaccination Rates

**18 STATES** had flu vaccine rates significantly below the U.S. rate.

**7 STATES** had flu vaccine rates that were not significantly different from the U.S. rate.

**27 STATES** and D.C. had flu vaccine rates significantly above the U.S. rate.

Significantly below the U.S. rate.

Significantly above the U.S. rate.

Not significantly different from the U.S. rate.
