

A STATE-LEVEL LOOK AT FLU VACCINATION RATES AMONG KEY POPULATION SUBGROUPS

SHADAC's analysis of 2017-2019 Behavioral Risk Factor Surveillance System (BRFSS) Data.

North Dakota

Though there is no consensus on one singular figure needed to achieve what is commonly known as “herd immunity” (i.e., sufficient levels of COVID vaccinations in order to achieve protective population immunity) scientists and researchers have generally agreed on a range of 70-90% of the population being vaccinated. For simplicity, we use the lower end of the target range (70%) as a comparison for these state profiles.

Using data from the U.S. Centers for Disease Control and Prevention's (CDC) Behavioral Risk Factor Surveillance System (BRFSS) survey, these profiles give a deeper look into flu vaccination rates across the states among U.S. adults (age 18+) as a proxy to identify population subgroups that may be harder to reach with a COVID-19 vaccine.

State Flu Vaccination Rate vs. COVID-19 Herd Immunity Threshold

STATE RATE

43%

HERD IMMUNITY THRESHOLD

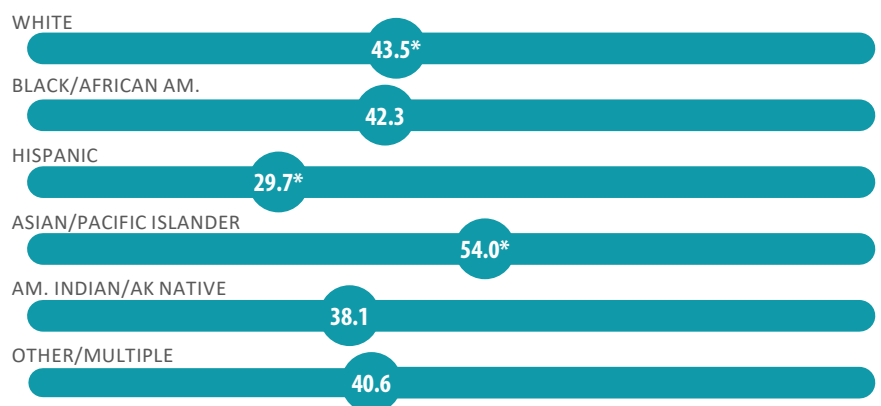

70%

Flu Vaccination Rates by Age

Flu Vaccination Rates by Race/Ethnicity

Flu Vaccination Rates by Insurance Status

Flu Vaccination Rates by Household Income

* Significantly different from the statewide rate (adults age 18+) at 95% confidence level.

State vs. National Adult Flu Vaccination Rates

18 STATES had flu vaccine rates significantly below the U.S. rate.

7 STATES had flu vaccine rates that were not significantly different from the U.S. rate.

27 STATES and D.C. had flu vaccine rates significantly above the U.S. rate.

Significantly below the U.S. rate.

Significantly above the U.S. rate.

Not significantly different from the U.S. rate.
