## KEEPING KIDS COVERED:

## Number of Children with Health Coverage Increases During Economic Downturn

## Executive Summary

This report analyzes recent trends in health insurance coverage for children at the state level between 2008 and 2010. The percentage of children with public coverage through Medicaid or the Children's Health Insurance Program (CHIP) increased substantially, while rates of private coverage and uninsurance declined. However, we find substantial variation across states. The main findings of this report include the following:

■ Between 2008 and 2010, while the rate of uninsurance for nonelderly adults increased from $19.4 \%$ to $21.4 \%$ nationally ${ }^{1}$, the uninsurance rate for children actually fell from $9.7 \%$ to $8.5 \%$. States with the biggest declines in the rate of uninsurance included Florida, Mississippi, Delaware, Colorado and Oregon.

- The percentage of children with coverage through Medicaid or CHIP increased by 5.6 percentage points nationally. Although private health insurance remains the dominant source of coverage, the percentage of children with private insurance fell from 64.5\% to 60.1\%. States with the largest increases in public coverage included Delaware, Mississippi, Vermont, Florida and Oregon, while states with the largest declines in private coverage included Vermont, Hawaii, Wyoming, Wisconsin and Delaware.
- The increase in public coverage among children is likely tied to the effects of the economic recession. The percentage of children living in low-income families increased in most states, as did the percentage of children living in families with no employed adults.

## Introduction

Since the beginning of the Great Recession at the end of 2007, difficult economic times have contributed to a loss of health insurance coverage - particularly employer-sponsored insurance (ESI) - for adults. However, trends for children have been somewhat different. Although children have also experienced declines in ESI, this loss of coverage has been more than made up by an increase in public sources of coverage. This report analyzes trends in children's coverage at the state level, and
by family income. It documents substantial variation in coverage for children across states, and in how children have fared with regard to health insurance coverage since 2008.

A 2010 State Health Access Data Assistance Center (SHADAC) and Robert Wood Johnson Foundation report documented significant variations in children's health insurance coverage, both within and across states. ${ }^{2}$ This report uses more recent data from the American Community Survey (ACS) to describe state-level trends in children's health insurance coverage. It takes advantage of the large sample size of the ACS in every state. ${ }^{3}$ It examines trends since 2008, when the ACS first included a question about health insurance coverage.

## Background

In recent years, states have invested significant resources and effort to ensure that children have access to health insurance coverage. In all but four states, children living in families with incomes up to $200 \%$ of federal poverty guidelines are eligible for Medicaid or CHIP. In contrast, the median eligibility level for working parents is $63 \%$ of poverty, and most states do not currently cover childless adults. ${ }^{4}$ As a result, children are less likely to be uninsured than adults, and more likely to be covered through state programs, such as Medicaid and CHIP.

One recent study documents at the national level how public coverage has offset declines in employer-sponsored insurance (ESI) for children during the recession that began in late 2007. The study documents a substantial shift in income for children between 2007 and 2010: during this period, the number of children living in families with incomes below 200\% of poverty increased by 3.9 million ( $47.3 \%$ of all children in 2010, up from $42.7 \%$ in 2007). For low-income children, the share with ESI fell by 3.6 percentage points, but a six percentage point increase in the share with Medicaid/CHIP coverage more than offset this loss. ${ }^{5}$ However, this study did not report state-level estimates.

[^0]In addition to changes in income, another factor that could be driving increases in public insurance coverage is expanded eligibility. At the national level, one study attributes about half of the increase in the number of children eligible for Medicaid and CHIP between 2008 and 2009 to the economy, and the other half to coverage expansions, with significant variation across states. ${ }^{6}$ Finally, increases in public insurance coverage for children could also arise from a change in the participation rate among eligible children. Nationally, children's participation in Medicaid/CHIP increased from $82.1 \%$ in 2008 to $84.8 \%$ in 2009, with substantial increases in some states. ${ }^{7}$

## Findings

We find that the percentage of children with public health insurance coverage increased from $25.8 \%$ in 2008 to $31.4 \%$ in 2010, a 5.6 percentage point increase (Table 1). In all but three states, the increase in the share of children with public coverage was statistically significant. The largest increases occurred in Delaware, Mississippi, Florida, and Vermont (Figure 1). These states were also among those experiencing the largest declines in private coverage for children, but all of them also showed a reduction in the percentage of children who were uninsured.

Tables 2 and 3 illustrate the coverage trends separately for low-income children (defined as children with family incomes at or below 200\% of poverty) and higherincome children. Nationally, the percentage of low-income children who had public coverage increased by 5.7 percentage points, while the share with private insurance declined by 3.0 percentage points, and the share who were uninsured declined by 2.7 percentage points. For low-income children, the change in public coverage between 2008 and 2010 ranged from a decline of 4.2 percentage points in the District of Columbia to an increase of 16.2 percentage points in Delaware (Figure 2). For higher-income children, there were many fewer states that experienced a significant increase in public coverage, and the magnitude of the increase was much smaller (Figure 3). Nationally, for higher-income children, private coverage was stable, public coverage increased, and the rate of uninsurance fell.

In nearly all states, the share of children living in families with income below 200\% of poverty increased significantly between 2008 and 2010 (Table 4). Among those with statistically significant increases, the change ranged from a 2.6 percentage point increase in Louisiana to 8.6 percentage points in Vermont. Similarly, most states experienced an increase in the percentage of children who lived in families where there was no employed adult (ranging from 1.2 percentage points in Minnesota to 6.6 percentage points in Vermont, among states with statistically significant changes).

Between 2008 and 2010, 10 states expanded eligibility for Medicaid or CHIP by increasing income limits. (Table 5) In addition, 13 states implemented one or more policies designed to make it easier for eligible children to enroll and stay enrolled in public coverage: six states implemented continuous eligibility for children, four states implemented presumptive eligibility and six implemented express lane eligibility.

## Discussion

The state-level analysis in this report shows that there is substantial variation across states in the trends that have affected health insurance coverage for children over the past few years. Although the coverage expansions in the Affordable Care Act are primarily aimed at adults, many provisions of the law will have impacts on children, and these impacts will vary by state. Because of variation in economic conditions and state policies, continued analysis of state-level trends is essential to understanding trends in health insurance coverage.

## Methodology

In this report, we analyze data from the American Community Survey (ACS). The ACS is an annual survey conducted by the U.S. Census Bureau that includes questions on a wide range of topics, including demographics, income, employment, and health insurance (beginning in 2008). The ACS is a mixed-mode survey that includes responses from mail, telephone, and inperson interviews. Nationally, about 4.5 million people respond to the ACS each year. The ACS collects data in every county in the nation, and its large sample size allows for more precise state-level estimates than other 50-state surveys. The sample is restricted to the non-institutional population. The data analysis for this report was performed with the ACS public use microdata sample, which includes nearly 733,801 children in 2008, 733,196 in 2009, and 732,906 in 2010.

The ACS collects data on all sources of health insurance coverage that a person has at the time of the survey. For this report, SHADAC analyzed the ACS data on health insurance by primary source of insurance coverage. If multiple sources of coverage were reported for a child, employer-sponsored insurance was considered primary over public sources of insurance such as Medicaid and CHIP, while nongroup coverage was assigned as primary only if no other coverage was reported.

To measure family poverty, income was totaled for all individuals in the health insurance unit. The health insurance unit is a narrower definition of family that more accurately reflects whose income is included when assessing public program eligibility for the individual. ${ }^{8}$ The income is divided by the federal poverty guidelines (FPG) produced by the U.S. Department of Health and Human Services to calculate the income as a percentage of FPG. ${ }^{9}$

Employment is defined as those who are at work or have a job and excludes those who are unemployed or not in the labor force. Parents are defined by those over age 18 who have children in their household.
Standard errors are produced using the ACS replicate weights described in the ACS variance estimation methodology. ${ }^{10}$

## About SHADAC

The State Health Access Data Assistance Center (SHADAC) is an independent health policy research center located at the University of Minnesota School of Public Health. SHADAC is a resource for helping states collect and use data for health policy, with a particular focus on monitoring rates of health insurance coverage and understanding factors associated with uninsurance. SHADAC is primarily funded by the Robert Wood Johnson Foundation.

## About the Robert Wood Johnson Foundation

The Robert Wood Johnson Foundation focuses on the pressing health and health care issues facing our country. As the nation's largest philanthropy devoted exclusively to improving the health and health care of all Americans, the Foundation works with a diverse group of organizations and individuals to identify solutions and achieve comprehensive, meaningful and timely change. For 40 years, the Foundation has brought experience, commitment, and a rigorous, balanced approach to the problems that affect the health and health care of those it serves. When it comes to helping Americans lead healthier lives and get the care they need, the Foundation expects to make a difference in your lifetime. For more information, visit www.rwjf.org. Follow the Foundation on Twitter www.rwjf.org/twitter or Facebook www.rwjf.org/facebook.
