Research Project to Understand the Medicaid Undercount: The University of Minnesota's State Health Access Data Assistance Center, the Centers for Medicare and Medicaid Services, the Department of Health and Human Services Assistant Secretary for Planning and Evaluation, the National Center for Health Statistics, the Administration for Healthcare Research and Quality, and the U.S. Census Bureau

Phase V Research Results:

Extending the Phase II Analysis of Discrepancies between the National Medicaid Statistical Information System (MSIS) and the Current Population Survey (CPS) Annual Social and Economic Supplement (ASEC) from Calendar Years 2000-2001 to Calendar Years 2002-2005.

[January 4, 2010]

Note: This paper was made possible by Grant 052084 from the Robert Wood Johnson Foundation to the State Health Access Data Assistance Center (Michael Davern, PI) with additional support supplied by the Office of the Assistant Secretary for Planning and Evaluation (ASPE), the Centers for Medicare and Medicaid Services (CMS), the National Center for Health Statistics (NCHS), the Administration for Healthcare Research and Quality (AHRQ), and the U.S. Census Bureau. This paper has undergone a limited review by all participating organizations in accordance to existing agreements among these organizations. The views expressed are those of the author(s) and not necessarily those of SHADAC, ASPE, CMS, NCHS, AHRQ or the U.S. Census Bureau.

T. Introduction

This paper describes the results of the fifth phase of a multi-phase research project coordinated by the University of Minnesota's State Health Access Data Assistance Center (SHADAC), Centers for Medicare and Medicaid Services (CMS), Assistant Secretary for Planning and Evaluation (ASPE), National Center for Health Statistics (NCHS), Administration for Healthcare Research and Quality (AHRQ), and U.S. Census Bureau. The research is designed to explain why discrepancies exist between survey estimates of enrollment in Medicaid and the number of enrollees reported in state and national administrative data.

Understanding the differences between enrollment and survey data will benefit the Census Bureau and other participating agencies by suggesting possible improvements to the Current Population Survey Annual Social and Economic Supplement (CPS ASEC) and other surveys. It will also contribute to a better understanding of existing CPS ASEC insurance data and provide a more accurate view of Medicaid and other insurance coverage for U.S. residents. As such, this research will enable a revised computation of the number of U.S. residents without health insurance.

II. **Objective**

The objective of Phase V is to determine if the conclusions of Phase II, which examined the size and cause of the Medicaid undercount using CPS ASEC and Medicaid Statistical Information System (MSIS) data for Calendar Year (CY) 2000 and CY 2001, are supported by more recent data. A major part of the Phase II work involved examining the feasibility of linking MSIS records to CPS ASEC records in order to gain insights into survey error as a cause for the undercount. The main conclusions of Phase II were:

- 1. When measured using raw counts (i.e., counts with no or minimal adjustments), the size of the undercount is about 35 percent (i.e., the CPS ASEC shows 35 percent fewer people enrolled in Medicaid than MSIS administrative records). Some of this raw undercount can be accounted for by the fact that the two data sources have different concepts of Medicaid coverage as well as different universes. When the counts are fully adjusted to account for these differences, the undercount is reduced by about 3 percentage points to 32 percent. 1
- 2. Linking MSIS records to CPS ASEC records is a feasible way to identify and analyze survey error on the CPS ASEC. Though a majority of records in both files contain the

¹ See Section IV (Conclusion #1) of this report for a list of the adjustments that were made. Note that some studies estimate the "raw" (or crude) undercount as a measure of the difference between the raw MSIS count and the adjusted CPS ASEC count, resulting in a higher raw undercount (about 42 percent) and hence a larger reduction in the adjusted undercount from the raw undercount (about 10 percentage points). While this method has merit, for simplicity this report uses a raw estimate based on unadjusted counts from both the MSIS and CPS ASEC.

appropriate identifiers to allow linking to take place, a significant number do not. To a certain extent, adjustments can be made to account for these un-linkable records, but this limitation must be kept in mind when analyzing results derived from the linked file.

- 3. The linked file suggests that a predominant part of the adjusted undercount can be accounted for by false negative respondent error (i.e., persons on the CPS ASEC being incorrectly classified as lacking Medicaid coverage). Most of this error comes from cases where enrollment status was explicitly reported (as opposed to cases where the enrollment status was imputed or edited).
- 4. Among the population with explicitly reported enrollment status, the occurrence of false negative responses is not random. The following characteristics differ significantly between error and non-error cases:
 - Income to Poverty Ratio
 - Length of enrollment in Medicaid
 - Receipt of medical services
 - Enrolled in Medicaid at time of survey

Phase V more thoroughly examines two aspects of the study that were touched upon in the Phase II report: the characteristics of the population with false positive errors, and the characteristics of the re-weighted CPS ASEC compared to the original CPS ASEC.

III. Methodology and Data Sources

Phase V uses the same methodology and data sources as Phase II, both in regard to measuring the size of the undercount and linking CPS ASEC and MSIS records. The same detailed summary statistics produced for Phase II are produced for Phase V; relevant tables are presented in Appendix I using the same format as was used in Phase II.² This report reexamines some of the cross-year results found in Phase II, and provides new analyses specific to Phase V.

3

² Additional tables showing intermediate weighting and universe adjustments are available upon request. Appendix I contains tables using the preferred weight and versions to be used for final comparisons. Tables 1, 2, and 4 include a row for records with unspecified Age. For these cases, age data were incomplete, under age zero or over age 120.

IV. Results: Phase II Conclusions

In this section, each of the Phase II conclusions is examined in light of the new data to see if the conclusion is still supported. While this report provides some description of the methodologies used, the Phase II report should be consulted for more complete descriptions.

Conclusion # 1: Size of the undercount

In Phase II, the undercount was measured as the difference between the number of persons actually enrolled in Medicaid according to MSIS and the number estimated using the CPS ASEC survey. However, there are differences both within and between these two data sources regarding who should be considered enrolled. Therefore, for each data source, Phase II computed enrollment in multiple ways. The Phase V analysis focused on just two approaches to measuring the undercount – a raw and an adjusted measure.³

The raw MSIS measure includes all cases except those for persons who are known to be deceased prior to the time of the CPS ASEC survey, while the raw CPS ASEC measure is the weighted sum of all persons classified as enrolled according to the variable MCAID (which is the variable used by the Census Bureau in its estimates of Medicaid enrollment). These measures correspond to the totals referred to in Phase II as "MSIS Total A" and "CPS Total A", respectively. For the adjusted measures, the totals "MSIS Total E" and "CPS Total B" were used. These measures make the following adjustments to "MSIS Total A" and "CPS Total A" in order to make the two data sources as compatible as possible:

MSIS Adjustments

- Exclude SCHIP clients
- Exclude clients receiving only partial benefits
- Exclude clients residing in institutional group quarters
- Exclude duplicate client accounts

CPS Adjustments

• Exclude SCHIP enrollees

• Exclude enrollees not explicitly described as having Medicaid coverage (i.e. persons classified as enrolled due to responses of "other" or "other public" to certain follow-up coverage questions)

As Table 1 shows, the raw measure of the undercount is fairly⁴ stable over time, ranging from 34 to 38 percent. Likewise, with the exception of CY 2002, the adjusted measure is stable, holding steady near 32 percent (but rising briefly to 38 percent in CY 2002) due to the fact the amount of the raw undercount that can be accounted for by universe and definitional differences remains

³ For a complete description of the issues involved in estimating the undercount and the adjustments made to address these issues, see the Phase II report, section III, Q2.

⁴ The years 2000 and 2001 are not significantly different and 2002 through 2005 are not statistically different. But, the years 2000 and 2001 are significantly different from 2002 through 2005.

relatively steady across time, in the range of 3 to 6 percentage points. Consequently the newer data can be said to add validity to the Phase II conclusion regarding the size of the undercount.

Conclusion # 2: Feasibility of linking MSIS and CPS ASEC records to analyze survey error.

The next step in the Phase II study was to link MSIS and CPS ASEC records in order to examine the part that reporting error plays in the undercount. Since linkage relies on a validated identifier, the feasibility of this approach depends upon the extent to which valid identifiers exist for records in the CPS ASEC and MSIS files. The Phase II study found that about 90 percent of the MSIS records and about 80 percent of the CPS ASEC records contained valid person identifiers and thus capable of being linked.

To a large extent, the CPS ASEC records without valid identifiers can be compensated for by reweighting the file to shift the weights of the records that lack valid identifiers to those in the validated sample.⁵ However, the Phase II report points out that while the re-weighting was done in a way meant to minimize bias in derived estimates, such re-weighting would be completely bias-free only if valid identifiers were missing on a random basis. Since in the real world complete randomness is unlikely, estimates derived from the re-weighted file will contain a certain amount of bias.

The evaluation of MSIS data lacking valid identifiers indicated that their distribution is significantly less random than in the CPS ASEC. Consequently, until the reasons for the lack of valid identifiers are better understood, the MSIS data are not re-weighted. The Phase II report concluded that the loss of 10 percent of the MSIS records did not prevent the linked file from being a useful tool for analysis.⁶

Table 2 shows that the portion of validated MSIS records is stable over time, staying close to 90 percent. Consequently, the problem of un-linkable MSIS records, while never large enough to

⁵ See Appendix III of the Phase II report for a description of how the re-weighting was done.

⁶ The Phase II report also recommended that the impact of this loss be analyzed in future reports.

significantly undermine the usefulness of the linked files, continues to be large enough that it should be addressed in the future.

Phase II and Phase V Detailed Tables: Table 1, Unweighted Presentation. CPS ASEC linked to Medicaid

Table 2 also shows that in most years the portion of CPS ASEC records that are linkable continues to be significantly lower than the portion of MSIS records that are linkable. Consequently, re-weighting the CPS ASEC continues to be the recommended option for the linked files. However, in the final year the CPS ASEC percentage of validated records rises dramatically to the level of the MSIS rate. This is most likely due to a change regarding the method of obtaining information necessary for linkage that started with the March 2006 CPS ASEC, and which we would expecte to continue in future years. While this change brings the portion of linkable CPS ASEC records in-line with the portion of linkable MSIS records, reweighting allows for the creation of a survey file better adapted to the needs of the study and maintains consistency with earlier phases.

Conclusion # 3: False negative survey error is a major contributor to the undercount.

The linked file identifies two types of survey errors. False negative errors are cases where the CPS ASEC does not classify a person as enrolled in Medicaid but that person has a matching MSIS record (i.e., the person in fact was enrolled in Medicaid). False positive errors are cases where the CPS ASEC classifies a person as enrolled in Medicaid but no matching MSIS record can be found (i.e., the person was in fact not enrolled in Medicaid or the person's MSIS record lacked an SSN for linkage).⁸

Although the Phase II study generated descriptive statistics for both the population with false negative errors and the population with false positive errors, the study focused on the former

⁷ Starting with the March 2006 CPS ASEC survey, respondents were no longer asked for an SSN. However, as part of this change the question asking if their data could be used for record-linkage purposes was rephrased. The net effect was an increase in the number of records with identifiers for record linkage.

⁸ Note that for this analysis, determination as to whether a CPS ASEC record had either of these errors was based on the "adjusted" definition of the undercount.

(Section V analyzes the false positive population). Looking at just those CY 2000 CPS ASEC cases that had a matching MSIS record (33.4 million, weighted), it found that while the number correctly classified by the CPS ASEC as enrolled in Medicaid was 19.1 million, the number of false negatives was nearly as large – 14.4 million. Phase II concluded that while this finding could not be applied directly to the undercount, the relative size of the population with false negative errors supports the conclusion that such errors are a critical factor in explaining the adjusted undercount. Phase II also found that most of this error (11 million persons) comes from cases where enrollment status was explicitly reported. For the remaining 3.3 million cases, the enrollment status was imputed or edited. Table 3 shows that for all of the years studied, similar conclusions can be drawn regarding the importance of false negative error as a contributor to the undercount.

| CPS ASEC linked to Medicaid administrat Notes: 1 Enrollment status is edited or | | | | | | | | | | | | | |

Table 3 also shows the "other insurance" status of the population with false negative errors (i.e. whether or not the person is categorized on the CPS ASEC as having any other insurance coverage, either public or private). This information is useful when considering the impact that the false negative population has on the estimate of the size of the uninsured population. Surveyed persons mistakenly classified as not enrolled in Medicaid will only affect the estimate of the uninsured population if they are not also classified as having any other insurance coverage. Table 3 shows that in all years only about 40% of the false negative population is classified as having no other insurance – i.e. less than half of the population with false negative errors has any impact on the estimate of the uninsured population.

⁹ That is, one could not conclude that eliminating all false negative survey errors would reduce the undercount by 14.3 million, since that value is based on the re-weighted CPS ASEC and ignores the un-linkable MSIS records. Furthermore, any accounting of the impact of eliminating false negative errors should also address the issue of false positive errors.

Conclusion # 4: The occurrence of false negative responses is not random.

The Phase II study found that among cases for which enrollment status was explicitly reported, ¹⁰ false negative responses increased as poverty and length of enrollment diminish. Furthermore, false negative responses were lower both among cases that had actually received medical services during the calendar year (as opposed to those enrolled in Medicaid but not requiring any medical services during the year), and among those who were enrolled in the survey year (as opposed to those only enrolled in the previous year). As Table 4 shows, these characteristics display a similar relationship to the false negative response rate across years.

V. Results: New Phase V Analysis

In this section, the results of two additional areas of analysis are presented. These areas were mentioned in the Phase II report but only minimal analysis was done at that time. The Phase V report picks up this analysis, using data from both the Phase II and Phase V studies.

Analysis of population with false positive errors

While false negative errors are an important cause of the undercount, a complete analysis should examine false positive errors as well. Unfortunately, the population of false positive cases is harder to analyze because of uncertainty with the un-linkable MSIS records¹¹ and the fact that

¹⁰ No analysis was done of the smaller population that had their enrollment status imputed, and the population which had their status edited can not be part of the false negative population (editing always adds enrollment and never takes it away).

¹¹ An apparent false positive case (i.e., a CPS ASEC case that is classified as enrolled but has no matching MSIS record) may in fact have a matching MSIS record among the un-linkable MSIS records, meaning that it is not

respondents may be confusing another program with Medicaid. Despite these obstacles, interesting insights can still be gained from a general analysis of the aggregate numbers.

Table 5 shows that compared with false negative errors, false positive errors are relatively small. Furthermore, whereas imputed/edited responses were a minor portion of the false negative population, they make up the majority of the false positive population. As with the estimate of the false negative population, this estimate of the false positive population cannot be directly applied to the undercount. However, it does support the conclusions that false positive errors account for a relatively small portion of survey error and are more likely to be the result of the imputation and editing processes than of respondent error.¹²

sums). CPS ASEC linked to Medicaid administrative data

Among the population with explicitly reported enrollment status, the relationship between poverty and false positive error is opposite of the Phase II results between poverty and false negative errors. As Table 6 shows, false positive respondent error increases as poverty increases. In contrast, the Phase II study had found that false negative respondent error decreases as poverty increases.

This positive relationship between poverty and the rate of false positive errors is not surprising when one considers two of the possible causes of false positive responses:

- Some of the false positive responders may be reporting enrollment in a program that, while not technically a part of Medicaid, works much like it (i.e., means-tested government programs).
- Some of the false positive responders could be persons who were recently un-enrolled in Medicaid and incorrectly reported that they were still enrolled.

actually a false positive case. While the un-linkable MSIS records also affect the identification of false negative cases, they do so only by preventing some false negative cases from being identified -- they do not cause non-error cases to be identified as error cases. Consequently, while the population of identified false negative cases may be understated, we are relatively confident that those cases identified as false negatives are correctly identified, whereas it is likely that the population of identified false positives contains cases that in fact are not false positives.

¹² It should be noted that editing and imputation each have different "data cleaning" goals, which in turn affect how such records should be used in the linking process. While it was outside the scope of this report to analyze these differences, future reports may include such an analysis.

Phase II and Phase V Detailed Tables: Table 4, Re-weighted, Version H. CPS ASEC linked to Medicaid administrative data.

As mentioned earlier, the presence of un-linkable MSIS records poses more of a conceptual problem for the false positive population than for the false negative population since the identified false positive population may contain cases that are not in fact false positive cases. Using an un-weighted analysis, Table 7 shows that the incorrect identification problem could potentially affect one-third to two-thirds of the identified false positive population. This table assumes that if the un-linkable MSIS records were in fact linkable (and not duplicates¹³), they would match up with CPS ASEC records at the same rate as the linkable records. It further assumes that the CPS ASEC records matched to these un-linkable records would have a similar pattern of CPS ASEC enrollment status as the CPS ASEC records matched to the linkable MSIS records.

¹ Non-enrollees are defined as linkable CPS ASEC records with no matching MSIS record.

Only persons explicitly reporting their enrollment status are included.

¹³ There is some evidence that a significant number of the unlinkable MSIS records are in fact duplicates. This issue should be kept in mind when considering the size of the false positive population, and warrants further investigation.

While the potential impact of the un-linkable MSIS records makes it hard to analyze the false positive population, it should be noted that the direction of the impact serves to strengthen the conclusion that false positive errors are much less common than false negatives. The existence of un-linkable MSIS records means the estimate of false negatives should probably be higher than our estimate, but the estimate of false positives should probably be lower than our estimate. Consequently, the difference between the sizes of the two populations is probably greater than our estimate, thereby further minimizing the overall importance of false positive errors compared with false negative errors.

Characteristics of the re-weighted CPS ASEC

An important part of creating useful linked files involves re-weighting CPS ASEC records to account for the portion that are not linkable (due to missing or incomplete identifying information). As explained in Appendix III of the Phase II report, the weights are adjusted so the re-weighted file matches the aggregate weight of the original file as well as the aggregate weight of those sub-populations that are most important to the research:

- Age
- Poverty
- Health Insurance Status

As Table 8 shows, the goals of the re-weighting were achieved in all years, with the relative sizes of these sub-populations after the re-weighting being almost identical to their relative sizes before the re-weighting. In addition, characteristics that were not explicitly aligned to (race, ethnicity, and sex) also align well with the original file.

As pointed out in the Phase II report, to the extent that the occurrence of un-linkable records is not random, some bias will be introduced to the file by the re-weighting, and this limitation should be kept in mind when analyzing results derived from the re-weighted file. Fortunately, Table 9 shows that, for all but the final year, the distribution of characteristics among the unlinkable population is similar in most cases to the distribution in the overall population, suggesting that bias in these re-weighted files is minimal.

However, there is a noticeable change in the characteristics of the CY2005 un-linkable population compared to previous years. As described in the analysis of conclusion # 2, in CY 2005 (the 2006 CPS ASEC) there was a significant increase in the number of linkable records, which was probably caused by a change in the question asking the respondent for permission to use survey data in conjunction with administrative records. While this increase in linkable records bodes well for future linkages of CPS ASEC and MSIS, the fact that the remaining unlinkable population in CY 2005 is less like the overall CY 2005 population than in previous years means that the nature of the bias introduced by re-weighting should be more closely examined in future years.

VI. Conclusion

Excluding the few exceptions noted in the body of this report, the results derived from the CY 2000 - CY 2005 data are stable over time. Consequently, the conclusion of this phase of the study is that the conclusions reached in the Phase II study using CY 2000 and CY 2001 data are supported by the CY 2002 – CY 2005 data. However, the same limitations that applied to the Phase II analysis continue to apply to the analysis of more recent years – about 10 percent of the MSIS cases and 20 to 30 percent of the CPS ASEC cases remain un-linkable, and the universes covered by the two data sources continue to be somewhat different (particularly in regard to their coverage of group quarters). While efforts have been made to overcome these limitations, they must continue to be kept in mind when considering the results of this study.

The new analysis performed in this phase indicates that false positive errors have a much less significant impact on the undercount than false negative errors. Furthermore, unlike false negative errors, false positive errors are much less a product of respondent error than of misclassification due to imputation and editing. Moreover, the re-weighting procedures are achieving the desired goals, and the bias introduced is minimal. However, the 2006 CPS ASEC, and presumably all subsequent years, has a much lower population of un-linkable records than previous years; the fact that the characteristics of this population are less like the overall population than in previous years suggests that further investigation of this population should be performed.

¹⁴ The exceptions are the CY 2005 increase in the portion of CPS ASEC records with a valid SSN, and the CY2002 spike in the adjusted undercount

¹⁵ Although for CY 2005 the rate is only 12 percent, and presumably will continue close to this rate in subsequent years.

- 1. All CPS Estimates are of weighted totals.
- 2. MSIS Total A is total enrolled in MSIS.
- 3. MSIS Total B is total MSIS without SCHIP.
- 4. MSIS Total C is total enrolled for full benefits.
- 5. MSIS Total D is total enrolled for full benefits, excluding residents of institutional-GQs.
- 6. MSIS Total E is total enrolled for full benefits, excluding residents of institutional-GQs and duplicative client accounts.
- 7. MSIS Total F is Total E excluding un-indentified clients: those having records with un-validated SSNs.
- 8. CPS Total A uses MCAID.
- 9. CPS Total B uses Augmented-CAID.
- $10.\ CPS\ Total\ C\ uses\ explicitly\ reported\ in\ Medicaid:\ Augmented-CAID\ (excluding\ imputed\ or\ edited\ responses).$

APPENDIX II. Summary of Undercount Computations

CPS CY2002 Unlinked Medicaid Undercount:

45.95 million MSIS cases (MSIS Total E)
-28.60 million Medicaid CPS responses (CPS Total B: all cases)
17.35 million persons

Restrict to validated cases:

45.95 million MSIS cases (MSIS Total E)

-2.90 million unvalidated MSIS cases

43.05 million MSIS cases (MSIS Total F)

CPS CY2002 Linked Medicaid Undercount:

43.05 million MSIS cases (MSIS Total F)

-38.60 million CPS CY2002-MSIS validated and linked cases

4.45 million persons

Adjusted CPS CY2002 Medicaid Undercount:

17.35 million Unlinked Medicaid Undercount (MSIS Total E – CPS Total B)

-4.45 million Linked Medicaid Undercount

12.90 million adjusted Medicaid Undercount

Potential CPS CY2002 Medicaid False Positive Count:

17.25 million incorrectly identified persons in linked data

-12.90 million adjusted Medicaid Undercount

4.35 million Medicaid false positive cases

CPS CY2003 Unlinked Medicaid Undercount:

45.60 million MSIS cases (MSIS Total E)
-30.85 million Medicaid CPS responses (CPS Total B: all cases)
14.75 million persons

Restrict to validated cases:

45.60 million MSIS cases (MSIS Total E)

-2.55 million unvalidated MSIS cases

43.05 million MSIS cases (MSIS Total F)

CPS CY2003 Linked Medicaid Undercount:

43.05 million MSIS cases (MSIS Total F)

-40.95 million CPS CY2003-MSIS validated and linked cases

2.10 million persons

Adjusted CPS CY2003 Medicaid Undercount:

14.75 million Unlinked Medicaid Undercount

-2.10 million Linked Medicaid Undercount

12.65 million adjusted Medicaid Undercount

Potential CPS CY2003 Medicaid False Positive Count:

17.68 million incorrectly identified persons in linked data

-12.65 million adjusted Medicaid Undercount

5.03 million Medicaid false positive cases

CPS CY2004 Unlinked Medicaid Undercount:

47.70 million MSIS cases (MSIS Total E)

-32.95 million Medicaid CPS responses (CPS Total B: all cases)

14.75 million persons

Restrict to validated cases:

47.70 million MSIS cases (MSIS Total E)

-2.65 million unvalidated MSIS cases

45.05 million MSIS cases (MSIS Total F)

CPS CY2004 Linked Medicaid Undercount:

45.05 million MSIS cases (MSIS Total F)

-43.25 million CPS CY2004-MSIS validated and linked cases

1.80 million persons

Adjusted CPS CY2004 Medicaid Undercount:

14.75 million Unlinked Medicaid Undercount

-1.80 million Linked Medicaid Undercount

12.95 million adjusted Medicaid Undercount

Potential CPS CY2004 Medicaid False Positive Count:

18.87 million incorrectly identified persons in linked data

-12.95 million adjusted Medicaid Undercount

5.92 million Medicaid false positive cases

CPS CY2005 Unlinked Medicaid Undercount:

49.20 million MSIS cases (MSIS Total E)
-33.65 million Medicaid CPS responses (CPS Total B: all cases)
15.55 million persons

Restrict to validated cases:

49.20 million MSIS cases (MSIS Total E)

-2.55 million unvalidated MSIS cases

46.65 million MSIS cases (MSIS Total F)

CPS CY2005 Linked Medicaid Undercount:

46.65 million MSIS cases (MSIS Total F)

-43.50 million CPS CY2005-MSIS validated and linked cases

3.15 million persons

Adjusted CPS CY2005 Medicaid Undercount:

15.55 million Unlinked Medicaid Undercount

-3.15 million Linked Medicaid Undercount

12.40 million adjusted Medicaid Undercount

Potential CPS CY2005 Medicaid False Positive Count:

18.67 million incorrectly identified persons in linked data

-12.40 million adjusted Medicaid Undercount

6.27 million Medicaid false positive cases
